

## Headquarters

## UK Headquarters

ESP's International headquarters was custom-built to accommodate the unique demands of our business mix.

Considerable attention was placed on the design of the facilities to allow current and new business strategies to be implemented in the form of the following specialist infrastructure:

- A highly resilient datacentre which hosts our Service Desk and Asset Management system, acts as a hub for customer's networking enabling simple and low cost connectivity to remote locations and for disaster recovery co-location.
- A Service Observation Centre (SOC) which facilitates the monitoring of each location where we have the responsibility to maintain equipment.
- Desktop Rollout and Network Configuration lab for larger installation, move, addition and change projects.
- A considerable workshop facility with space to manage the repair loop from end to end.

A warehouse with impressive storage and logistics capability catering for 700 pallets via a fully managed stock control system.

These facilities allow us to offer bespoke services to customers in a secure environment which is essential to the ATI industry.

The prominent position opposite the football stadium allows the building to be easily recognised on the Reading landscape being on the main artery from the motorway into central Reading.
